

**AMENDMENTS TO THE CLAIMS**

Claims 1-9 (Canceled)

Claim 10 (Previously Presented): An apparatus for processing data in a spread spectrum system, comprising:

a decimation circuit having an associated decimation factor;

a memory, which is a single port RAM, coupled to said decimation circuit, wherein said memory is divided into memory blocks such that during processing a first subset of memory blocks is in a Read mode and a second subset of memory blocks is in a Write mode; and

an interpolation circuit coupled to said memory, said interpolation circuit having an associated interpolation factor;

wherein said decimation circuit decimates a data rate of received data by said decimation factor to a decimated rate and stores said received data into said memory at said decimated rate; and

wherein said interpolation circuit interpolates said decimated rate by said interpolation factor to an interpolated rate and retrieves said received data from said memory at said interpolated rate.

Claim 11 (Original): The apparatus of claim 10, further comprising a plurality of despreaders.

Claim 12 (Original): The apparatus of claim 11, wherein each of said plurality of despreaders includes:

a selector circuit; and

a rake finger.

Claim 13 (Original): The apparatus of claim 12, wherein each of said memory blocks are divided into segments such that data stored in each segment is read out sequentially onto a bussing element accessible by multiple rake fingers via selector circuits in said plurality of despreaders.

Claim 14 (Original): The apparatus of claim 12, wherein said selector circuit includes a block multiplexer, a plurality of sample multiplexers, and a cache coupled to each rake finger.

Claims 15-19 (Canceled)

Claim 20 (Previously Presented): An apparatus for processing data in a spread spectrum system, comprising:

a decimation circuit having an associated decimation factor;

a memory, which is a circular buffer including multiple registers, coupled to said decimation circuit;

an interpolation circuit coupled to said memory, said interpolation circuit having an associated interpolation factor; and

a plurality of despreaders, wherein each of said plurality of despreaders includes:

a selector circuit; and

a rake finger;

wherein said decimation circuit decimates a data rate of received data by said decimation factor to a decimated rate and stores said received data into said memory at said decimated rate;

wherein said interpolation circuit interpolates said decimated rate by said interpolation factor to an interpolated rate and retrieves said received data from said memory at said interpolated rate; and

wherein said selector circuit includes a first set of multiplexers for selecting in-phase data, a second set of multiplexers for selecting quadrature data, and multiple sample select lines coupled to each rake finger.

Claims 21-23 (Canceled)

Claim 24 (Original): An apparatus for processing data, comprising:

a plurality of rake fingers;

a memory for storing data at the input to said plurality of rake fingers; and

a selector circuit positioned between said memory and each of said plurality of rake fingers;  
wherein said plurality of rake fingers can access said memory substantially simultaneously  
via a respective selector circuit, and

wherein said selector circuit includes a first plurality of multiplexers for selecting in-phase  
data from said memory, a second plurality of multiplexers for selecting quadrature data from said  
memory, and a set of select lines for controlling data being selected by said first plurality of  
multiplexers and said second plurality of multiplexers.

**Claim 25 (Original):** The apparatus of claim 24, wherein said memory is a circular buffer including  
a plurality of registers.

**Claim 26 (Canceled)**

**Claim 27 (Original):** The apparatus of claim 24, wherein said memory is a single-port RAM.

**Claim 28 (Previously Presented):** An apparatus for processing data, comprising:

    a plurality of rake fingers;  
    a memory, which is a single-port RAM, for storing data at the input to said plurality of rake  
    fingers; and  
    a selector circuit positioned between said memory and each of said plurality of rake fingers;  
    wherein said plurality of rake fingers can access said memory substantially simultaneously  
    via a respective selector circuit; and

    wherein said memory is divided into memory blocks such that, during each processing cycle,  
    a first subset of said memory blocks is in a Read mode and a second subset of said memory blocks  
    is in a Write mode.

**Claim 29 (Original):** The apparatus of claim 28, wherein each of said memory blocks is divided  
into segments, such that data stored in each segment is read out sequentially onto a bussing element.

Claim 30 (Original): The apparatus of claim 29, wherein said selector circuit includes a block multiplexer, a plurality of sample multiplexers, and a cache coupled to each rake finger.

Claim 31 (Original): The apparatus of claim 30, wherein said block multiplexer selects a bussing element to receive data from a segment.

Claim 32 (Original): The apparatus of claim 31, wherein said sample multiplexers selects data received from said block multiplexer and stores said data into said cache.

Claim 33 (Original): An apparatus for processing data in spread spectrum systems, comprising:

a memory coupled to a set of despreaders via a bus;

each of said set of despreaders including:

    a block multiplexer coupled to said bus;

    a set of sample multiplexers coupled to said block multiplexer;

    a cache coupled to said sample multiplexers; and

    a rake finger coupled to said cache; and

wherein said set of despreaders can access samples stored in said memory substantially simultaneously via said bus.

Claim 34 (Original): The apparatus of claim 33, wherein said memory is divided into blocks such that during a processing cycle by a despread, a first subset of said blocks is in a Read mode and a second subset of said blocks is in a Write mode.

Claim 35 (Original): The apparatus of claim 34, wherein said blocks are divided into segments such that samples stored in each of said segments are read out sequentially onto a bussing element coupled to said bus.

Claim 36 (Original): The apparatus of claim 35, wherein said block multiplexer in each of said despreaders selects samples from one bussing element.

Claim 37 (Original): The apparatus of claim 36, wherein said sample multiplexers in each of said despreaders select appropriate Early, On-Time, and Late samples among samples received from said block multiplexer to be stored into said cache.
